

Abstract

This experiment tested whether nitrogen affects tomato plant height in a controlled environment. This is because nitrogen is essential for plant growth and was expected to yield taller tomato plants from high levels of nitrogen fertilizer.

All plants grew from seeds, and the results were compared after 50 days. The experiment used three groups: one control group that didn't receive any nitrogen fertilizer and two experimental groups. One experimental group received low levels of nitrogen fertilizer and the other, higher levels.

Using an ANOVA, the plants with higher nitrogen levels were taller. In comparison, those with lower nitrogen levels exceeded the control group. Compared to previous findings and expectations, the effects of nitrogen on plant height were statistically significant.
