Abstract

As the temperature decreases, the rate of molecular motion slowly decreases. Molecules that are bonded remain close to the fixed position, moving only slightly away from their fixed position. They can move from one fixed position to the adjacent position of the crystal lattice. Molecules separated from the crystal lattice are free to move about. Above the point of the change in property, approximately 40 K for the amorphous form, the two molecules are free to move about, and are separated enough to allow the two polymer chains to slide past one another. The two molecules are free to move about, and are separated enough to allow the two polymer chains to slide past one another. The two molecules are free to move about, and are separated enough to allow the two polymer chains to slide past one another.
