Biomembrane Structure and Function Dennis Chapman, 1983-06-18 **SAM-TR.** ,1967-02 *Modern Aspects of Reflectance Spectroscopy* W. W. Wendlandt, 2012-12-06 This volume contains all of the papers presented at the American Chemical Society Symposium on Reflectance Spectroscopy The Symposium was presented under the sponsorship of the Division of Analytical Chemistry and was held on September 11 and 12 1967 at the 154th National Meeting of the American Chemical Society Chicago Illinois The papers presented herein represent a renaissance of interest in reflectance spectroscopy The technique of reflectance spectroscopy is not of course a new technique however it has only been applied to problems of a chemical interest in the last decade or so The instrumentation for this technique in the ultraviolet visible and near infrared regions of the spectrum has been available for many years New and exciting research is being carried out at the present time to extend these techniques to the infrared and far infrared regions as well It is a pleasure for the Editor to express his gratitude to Drs John K Taylor and E C Dunlop of the Division of Analytical Chemistry ACS for their cooperation in making the Symposium a reality The assistance of Miss Julie Norris of the University of Houston for her typing and manuscript organization skill is greatly appreciated And lastly but certainly not the least the Editor would like to acknowledge the cooperation of all of the contributors to this volume Certainly without their cooperation this Symposium would not have been a success

Angiogenesis is the physiological process where new blood vessels grow from existing ones in order to replenish tissues suffering from inadequate blood supply Perhaps the most studied angiogenic process occurs in solid tumors whose growing mass and expanding cells create a constant demand for additional supply of oxygen and nutrients for survival However other physiological and clinical conditions such as wound healing ischemic events autoimmune and age related diseases also

involve angiogenesis Angiogenesis is a well structured process that begins when oxygen and nutrients are depleted leading to the release of chemokines and growth factors that attract immune cells particularly macrophages and endothelial cells to the site Macrophages that are recruited to the site as well as tissue cells and endothelial cells secrete pro angiogenic mediators that affect endothelial cells and promote angiogenesis These mediators include growth factors such as vascular endothelial cell growth factor VEGF matrix metalloproteinases MMPs as well as low levels of mediators that are usually seen as pro inflammatory but are pro angiogenic when secreted in low levels e g nitric oxide NO and TNFa Thus macrophages play a major role in angiogenesis Macrophages exhibit high plasticity and are capable of shifting between different activation modes and functions according to their changing microenvironment Small differences in the composition of activating factors e g TLR ligands such as LPS anti inflammatory cytokines ECM molecules in the microenvironment may differently activate macrophages to yield classically activated macrophages or M1 macrophages that can kill pathogen and tumor cells alternatively activated macrophages or M2 macrophages that secrete antiinflammatory cytokines resolution macrophages rM that are involved in the resolution of inflammation or regulatory macrophages e g Myeloid Derived Suppressor Cells MDSCs that control the function of other immune cells In fact macrophages may be activated in a spectrum of subsets that may differently contribute to angiogenesis and in particular non classically activated macrophages such as tumor associated macrophages TAMs and Tie2 expressing monocytes TEMs can secrete high amounts of pro angiogenic factors e g VEGF MMPs or low levels of pro inflammatory mediators e g NO or TNFa resulting in pro angiogenic effects Although the importance of macrophages as major contributors and regulators of the angiogenic process is well documented less is known about the interactions between macrophages and other cell types e g tumor cells normal epithelial cells endothelial cells that regulate angiogenesis We still have only limited understanding which proteins or complexes mediate these interactions and whether they require cell cell contact e g through integrins or soluble factors e g the EGF CSF 1 loop which signaling pathways are triggered in each of the two corresponding cell types and how this leads to secretion of pro or antiangiogenic factors in the microenvironment The regulation of such interactions and through them of angiogenesis whether through post translational modifications of proteins or via the involvement of microRNA is still unclear The goal of this Research Topic is to highlight these interactions and their regulation in the context of both physiological and pathological conditions
