Population dynamics

Population dynamics
Introduction

Understanding Population Dynamics
Population dynamics is the study of how and why the number of individuals in a population changes over time. It involves understanding the factors that influence birth rates, death rates, and migration.

Key Concepts and Definitions
Population: A group of individuals of the same species living in the same area at the same time.
Birth rate: The number of new individuals added to a population per unit time.
Death rate: The number of individuals that die per unit time.
Migration: The movement of individuals into or out of a population.

Population Growth
Population growth occurs when the birth rate is higher than the death rate. This can be represented by the equation: $\text{Population Growth} = \text{Birth Rate} - \text{Death Rate}$.

Population Size
Population size is the total number of individuals in a population. It can be estimated using various methods, including direct counting, mark-recapture, and indirect methods.

Population Density
Population density is the number of individuals per unit area. It can be calculated by dividing the population size by the area.

Population Structure
Population structure refers to the distribution of individuals within a population based on age, sex, and other characteristics.

Population Change
Population change is the difference between the population size at two different times. It can be calculated using the equation: $\text{Population Change} = \text{Population Size}_2 - \text{Population Size}_1$.
