A life cycle analysis

TRANSPORTATION
DISTRIBUTION

MMaterials used in the transportation and distribution are steel plastic (aluminum), foam (padding), paper (instruction manuals), AA Batteries which is steel and a mix of zinc/manganese/potassium/graphite, with the remaining balance made up of paper and plastic. The energy used most is in packaging products (mechanical), transportation through trucking, and cargo ships with fossil fuels (chemical). The waste is shown in shipping using trucks emit carbon dioxide and impact climate change, steel boxes used in packaging can be recycled but many people wash them and they end up in landfills.

USE REUSE RECYCLE

When being around, would like to see high prices. These machines are likely not to be chosen any longer, used or sold to another person in need of this instrument or hope for continued personal use. This is source of maintenance, one would need to replace the plastic bands occasionally if they break. The energy and chemical energy is power production and more to the income. The waste produced is a byproduct, can be hazardous because of the metal and chemical content, and need to be disposed of in a specific way depending on region.

RECYCLING

When not in use, the parts of a down machine can be recycled such as the aluminum and plastic. Likewise, the instruments can be used and sold for years, since it also is a piece of technology. Many of the parts can still be used for other purposes. The type of energy used in recycling is chemical energy being used to generate plastic recycling. Unlike art of recycled material as initial basis to make stronger. When products included plastic can be recycled for many end up in landfill and cause pollution. Rubber is harder to recycle, and can have negative impacts on the environment when they end up in landfill.
