

What is a Simplified Representation?

Simplified Representations provide a means of changing the view of a particular design. They allow control over which members of an assembly are retrieved into workstation memory and displayed. This allows the work environment to be tailored include only information of current interest. For example, a complex sub-assembly that is unrelated to the portions of the assembly that are currently being worked on can be temporarily removed. This functionality offers an increase in performance due to a reduction in regeneration and display time.

***What is a Merge?**

A Merge operation adds the material from every one of the second set of parts selected into every one of the first set of parts selected. Depending on the additional options available, the features and relations of the second set of parts may be copied into each of the first set of parts, or they may be referenced by the first set of parts. This operation creates the feature called "merge".

***What is a Cutout?**

A Cutout subtracts the material of every one of the second set of parts selected from every one of the first set of parts selected. Like the Merge function, depending on the additional options selected, the features and relations of the second parts may be copied into the first parts or may be referenced by the first parts. This operation creates the feature referred to as a "cut out".

***What is an Interchange Assembly?**

Interchange assemblies provide both a mechanism for relating functionally equivalent models, and a way to relate different visual representations of the same model.

***What is a Mate Placement Constraint?**

A Mate placement constraint causes two surfaces to be coincident. The outward normals of the surface will face in opposite directions. When selecting datum planes, the red or yellow side must be specified. Mate Offset can be used to cause two surfaces to be parallel and facing each other, but separated by a given distance.

***What is an Align Placement Constraint?**

An Align placement constraint causes two surfaces to be coincident. The outward normals of the surface will face in the same direction. When selecting datum planes, the red or yellow side must be specified. Align Offset can be used to cause two surfaces to be parallel, but separated by a given distance. The Align constraint can also be used to cause axes to be coaxial, or two points, vertices, or curve ends to be coincident.

***What is an Insert Placement Constraint?**

An Insert placement constraint can be used to place a "male" revolved surface into a "female" revolved surface by aligning their respective axes.

***What is an Orient Placement Constraint?**

An Orient placement constraint causes two surfaces to be parallel. The outward normals of the surfaces will face in the same direction, but no offset dimension is specified.

***What is a Coord Sys Placement Constraint?**

The Coord Sys placement constraint places a component into an assembly by aligning its coordinate system with a coordinate system in the assembly (both part and assembly coordinate systems may be used). The coordinate systems may either be selected on the screen, or chosen by name with Sel By Menu.

***What is a Tangent Placement Constraint?**

The Tangent placement constraint is used to control the contact of two surfaces at their tangency.

***What is a Pnt On Srf Placement Constraint?**

The Pnt On Srf placement constraint is used to control the contact of two components at a point. A part or assembly datum point or vertex can be constrained to be in contact with a solid surface or datum plane. For an example of a Pnt On Srf placement constraint, refer to Using the Point On Surface Assembly Constraint.

***What is an Edge On Srf Placement Constraint?**

The Edge On Srf placement constraint is used to control the contact of two components at a straight edge. The edge must be straight, and the surface must be planar. For an example of a Edge On Srf placement constraint, refer to Using the Edge On Surface Assembly Constraint.
