Relationships and Biodiversity

A Laboratory Activity for the Living Environment

Introduction

Botana curus is a valuable plant because it produces Curol, a compound used for treating certain kinds of cancer. Curol cannot be produced in the laboratory. *Botana curus* grows very slowly and is on the endangered species list, so its ability to provide Curol in large quantities is limited. Species that are more closely related to *Botana curus* are more likely to produce the important substance Curol. Three similar plant species that are plentiful (X, Y, and Z) may be related to *Botana curus*.

You will work as a researcher to:

1. Gather structural and molecular evidence to determine which plant species is most closely related to the hypothetical species, *Botana curus*
2. Use this evidence to decide which plant species is most likely to serve as a source of the important substance Curol

Structural Evidence for Relationships

Procedure. Perform the following and record your observations in Table 1 on page 6.

Test 1. Structural Characteristics of Plants

Compare the structural characteristics of the plant samples. Are the leaves oval shaped, spade shaped or irregular shaped? Do the lines run lengthwise or across? Record your observations in Table 1 Column 1.

Test 2. Structural Characteristics of Seeds

Compare the structural characteristics of the seed samples. Are the seeds large, medium or small? Are they black, or gray? Record your observations in Table 1 Column 2.

Test 3. Microscopic Internal Structure of Stems

- a. Examine the microphotographs that show cross sections through stems of *Botana curus* and Species X, Y, and Z. Compare and choose the arrangement (circular or scattered) for the bundles of conducting tissue in each of the specimens. Refer to Figure 1.

- b. Record your observations of the conducting tissue arrangements in Table 1 Column 3.
