Science and Environment in Chile Javiera Barandiaran, 2018-07-31 The politics of scientific advice across four environmental conflicts in Chile when the state acted as a neutral broker rather than protecting the common good In *Science and Environment in Chile* Javiera Barandiaran examines the consequences for environmental governance when the state lacks the capacity to produce an authoritative body of knowledge Focusing on the experience of Chile after it transitioned from dictatorship to democracy she examines a series of environmental conflicts in which the state tried to act as a neutral broker rather than the protector of the common good She argues that this shift in the role of the state occurring in other countries as well is driven in part by the political ideology of neoliberalism which favors market mechanisms and private initiatives over the actions of state agencies Chile has not invested in environmental science labs state agencies with in house capacities or an ancillary network of trusted scientific advisers despite the growing complexity of environmental problems and increasing popular demand for more active environmental stewardship Unlike a high modernist empire state with the scientific and technical capacity to undertake large scale projects Chile's model has been that of an umpire state that purchases scientific advice from markets After describing the evolution of Chilean regulatory and scientific institutions during the transition Barandiaran describes four environmental crises that shook citizens trust in government the near collapse of the farmed salmon industry when an epidemic killed millions of fish pollution from a paper and pulp mill that killed off or forced out thousands of black neck swans a gold mine that threatened three glaciers and five controversial mega dams in Patagonia

A Guide to identifying priorities and indicators for restoration monitoring Food and Agriculture Organization of the United Nations, 2019-09-25 This guide walks

practitioners through seven questions to help them make decisions regarding restoration monitoring First practitioners are asked to determine their restoration goals land use and barriers to sustainability These choices are filtered by constraints and priorities so the practitioner will develop the indicators needed to setup their monitoring framework It provides a framework for identifying indicators Indicators are value laden measures of development performance designed to measure and calibrate progress Environmental indicators are used to provide synthesized knowledge on environmental issues and to highlight the extent of environmental trends They also help to reduce complexity provide important links between science and policy and help decision makers to provide guidance on environmental governance An indicator framework can provide a management tool to help countries develop implementation strategies and allocate resources accordingly to reach restoration goals Tracking progress with indicators can act as a report card to measure progress towards restoration and help ensure the accountability of all stakeholders for achieving the goals The guide uses country case studies to show how a practitioner could answer the questions offering a menu of potential indicators for measuring progress that other monitoring practitioners might find useful Next it highlights the different types of data that can feed into creating an indicator framework depending on resource constraints and information needs Some restoration programs may require fewer cost effective indicators that are collected locally Other programs may be able to integrate small locally collected data with big data from satellite imagery and social media
