

Understanding biological & biosimilar medicines

Frequently Asked Questions

Q. What is a biological medicine?

A. Biological medicines, including biosimilars, are derived or manufactured from a living biological system. They include hormones (e.g. insulin), enzymes (to speed up chemical reactions), blood factors (to regulate clotting), antibodies (to support the immune system), vaccines and advanced therapies (such as cell, gene and tissue therapy products).

Biological medicines are among many of today's most important medicines. By 2020, it is predicted that seven of the top ten medicines worldwide will be biological.*

Q. What is a biosimilar medicine?

A. A biosimilar is a biological medicine that is developed to be similar to an approved biological medicine (the 'originator' biological medicine) and can only be marketed after the patent and data exclusivity period has expired. As its name suggests, a biosimilar is not an exact copy of its originator biological medicine due to its complex molecular structure and unique manufacturing process. Manufacturers of biosimilars are required to demonstrate that there are no clinically meaningful differences between the biosimilar and originator biological medicine in terms of safety, quality and efficacy.*

Q. What is a small molecule medicine?

A. Small molecule medicines are made by combining certain chemicals in a defined series of chemical reactions. Because these molecules are smaller and involve fewer process steps than biological medicines, they are easier to duplicate. This kind of medicine is often taken orally, most often as a pill.

Generic medicines: A medicine that contains an exact copy of the active pharmaceutical ingredient of the small molecule originator medicine.

Biological medicines: Biological medicines, including biosimilars, that have been developed in living organisms.

Originator medicines: The original medicine on which a biosimilar or generic drug bases its application for marketing authorisation.

Q. How are biological medicines different?

A. There are several key differences between biological and small molecule medicines:

- **Molecular structure** – biological medicines are much larger and more complex than small molecule medicines.
- **Development and manufacture** – biological medicines have complex manufacturing processes that must be tightly controlled to provide a consistent product.
- **Immunogenicity** – due to their size and complexity, biological medicines have the potential to induce unwanted or unexpected immune reactions.
- **Administration** – most biological medicines, including biosimilars, must be administered by injection or infusion.
- **Transport and storage** – biological medicines generally degrade quickly if subject to high temperatures. Therefore, biological medicines, including biosimilars, usually need to be stored in a refrigerator.

Biosimilar Clinical Development: Scientific Considerations and New Methodologies Kerry B. Barker, Sandeep M. Menon, Sr. D'Agostino, Siyan Xu, PhD Jin, 2016-11-25 Biosimilars have the potential to change the way we think about identifying and managing health problems. They are already impacting both clinical research and patient care, and this impact will only grow as our understanding and technologies improve. Challenges in Nonhuman Primate Research in the 21st Century Gerhard F. Weinbauer, Friedhelm Vogel, 2013 In continuation of the Covance Primate Symposium Series, the 19th Covance Primate Symposium took place in Münster on 23rd-24th of May 2012. Altogether 70 participants representing 43 organisations gathered for this symposium. The 2012 Primate Symposium focussed on Challenges in Nonhuman Primate Research in the 21st Century. The broad participation and the lively discussions during the symposium underlined the timeliness and importance of this topic. Expert speakers covered four major topics: i.e. biosimilars development, regulatory implications, key considerations, and next steps; optimizing nonhuman primate use in nonclinical safety assessment; trends in nonhuman primate developmental/reproductive toxicology; DART and juvenile toxicity evaluation and relevance, and importance of nonhuman primate models in regulatory toxicology. The development of biosimilars has taken up speed considerably, and meanwhile needs to be considered a significant factor of potential drug development. Yet there are still some uncertainties, and guidelines are under development. With the increased focus on biopharmaceuticals and the associated increase for using nonhuman primates as the relevant animal model, it became necessary to optimize the use of this animal model, e.g. refine study designs and animal numbers, but still execute meaningful preclinical studies. It appears that significant progress has been achieved in that context. In the area of nonhuman primate DART and juvenile toxicity evaluation, recent guideline changes had a major impact on species selection and the experimental design, plus the timing of these studies within the preclinical programmes. Finally, given the increasing regulations and justifications of using nonhuman primates as experimental models, it is paramount to understand the essential and indispensable role that nonhuman primates can play in drug safety evaluation and medical drug development.
