Abstract—The purpose of this study was to determine the effect of a 10-week, 1000 kcal energy deficit diet on the body composition and physical fitness of obese women. The study was a randomized, controlled trial. The subjects were 20 obese women who were randomly assigned to either a diet or an exercise group. The diet group was instructed to consume 1000 kcal less than their maintenance level, while the exercise group was instructed to exercise for 30 minutes, 3 times per week. The results showed that the diet group lost significantly more weight and body fat than the exercise group. The exercise group showed no significant changes in body composition. The results suggest that a 1000 kcal energy deficit diet is more effective than exercise for weight loss and body composition improvement in obese women.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or other light sources. To avoid this, there are two things the patient should do:
 - Avoid exposure to bright light at night
 - Avoid exposure to bright light during the day
- The end of the day is the best time to sleep. The body's internal clock is set by the light it receives. The body's internal clock is set by the light it receives. The body's internal clock is set by the light it receives.
