Population Genetics in Forestry

Hans-Rolf Gregorius, 2013-03-13 When we consider the main object of forestry the tree it immediately becomes clear why experimental population geneticists have been so hesitant in making this object a primary concern of their research Trees are very long living organisms with generation intervals frequently exceeding those of their investigators by multiples They virtually exclude therefore application of the classical methods of population genetics since these are based on observing genetic structures over generations This situation where the limits set to observation are so severe particularly requires close cooperation between theory and experiment It also requires careful consideration of results obtained for organisms other than trees in order to gain additional insights by comparing the results for trees with those for other organisms Yet the greatest challenge to population and ecological genetics probably originates from the fact that forests are very likely to be the most complex ecosystems of all even in some cases where they are subject to intense management This complexity which equally comprises biotic and abiotic factors

varying both in time and space makes extremely high demands on the adaptational capacity and thus flexibility of the carriers of such an ecosystem. Longevity combined with immobility during the vegetative phase however appears to contradict the obvious necessity of adaptational flexibility in forest tree populations when compared with short lived and or mobile organisms.

A baseline studies programme for sustainable and resilient seaweed cultivation in Faroese fjords Wegeberg, Susse, Mols-Mortensen, Agnes, Hancke, Kasper, á Norði, Gunnvør, Available online <https://pub.norden.org/temanord2023/551> The overall aim of this report is to provide an overview of the most relevant environmental effects and potential impacts on the marine environment related to seaweed cultivation in the Faroe Islands. The identified environmental impacts were evaluated for their relevance and significance for cultivation in the Faroe Islands. The report includes a number of potential effects and impacts that have been identified and addressed according to their expected significance. From this scoping of potential environmental impacts from seaweed cultivation in the Faroe Islands a baseline programme is suggested. Such a baseline programme and a consecutive monitoring program is needed to safeguard a future sustainable and resilient macroalgal cultivation in Faroese fjords. The suggested baseline programme is a first step in this direction.

Population Genetics of Forest Trees W.T. Adams, Steven H. Strauss, Donald L. Copes, A.R. Griffin, 1992-11-30 Tropical climates which occur between 23° 30' N and S latitude Jacob 1988 encompass a wide variety of plant communities Hartshorn 1983 1988 many of which are diverse in their woody floras. Within this geographic region temperature and the amount and seasonality of rainfall define habitat types UNESCO 1978 The FAO has estimated that there are about 19 million km² of potentially forested area in the global tropics of which 58% were estimated to still be in closed forest in the mid 1970s Sommers 1976 UNESCO 1978 Of this potentially forested region 42% is categorized as dry forest lifezone 33% is tropical moist forest and 25% is wet or rain forest Lugo 1988 The species diversity of these tropical habitats is very high Raven 1976 in Mooney 1988 estimated that 65% of the 250 000 or more plant species of the earth are found in tropical regions. Of this floristic assemblage a large fraction are woody species. In the well collected tropical moist forest of Barro Colorado Island Panama 39 7% 481 of 1212 species of the native phanerogams are woody arborescent species Croat 1978 Another 21 9% are woody vines and lianas Southeast Asian Dipterocarp forests may contain 120 200 species of trees per hectare Whitmore 1984 and recent surveys in upper Amazonia recorded from 89 to 283 woody species 10 cm dbh per hectare Gentry 1988 Tropical communities thus represent a global woody flora of significant scope.
