Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were divided into two groups: a control group and a training group. The control group consisted of 10 men who did not participate in any physical activity during the study. The training group consisted of 10 men who participated in a 10-week training program. The training program consisted of three sessions per week, each lasting 30 minutes. The sessions were performed at a heart rate of 150 beats per minute. The HR and HRR were measured at the beginning and end of the study. The results showed that the training group had a significantly higher HR and HRR at the end of the study compared to the control group. This suggests that a 10-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

If you are not satisfied with your results, follow the instructions carefully and test your original article. If the editor still requests the (a) paragraph and (b) paragraph, you should repeat the analysis with the original data.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or natural light at night. To reduce the risk of circadian rhythm disruption, it is recommended that the amount of artificial light be reduced to the lowest level possible.
- Artificial lights that emit red light with a wavelength of 620 nm or longer are less likely to disrupt the circadian rhythm. The length of the exposure may also be important for the red light exposure. Red light exposure should be limited to 10 minutes or less, and the intensity should be less than 100 lux. Red light exposure should be avoided during the day.
- The use of artificial light at night may also disrupt the circadian rhythm. The use of artificial light at night should be avoided. If artificial light is necessary, it should be used at a low intensity and for a short duration.

- When a producer's price for the output rises or falls, it must adjust its output level accordingly. For example, if the price of the output rises, the producer will want to produce more of the output, and if the price falls, the producer will want to produce less of the output.
