

A Closer Look at Area of Regular Polygons **NOT**

A **regular polygon** is a polygon in which all sides are congruent and all angles are congruent.

Equilateral triangle
Equilateral triangle

Square

Regular pentagon

Any regular polygon can be divided into non-overlapping congruent triangles. The area of this regular polygon can be found by finding the area of one of the triangular regions and multiplying by the number of sides of the polygon. This method can be written as follows in the formula:

$$\text{Area of a regular polygon} = \frac{1}{2}Pn$$

where P represents the perimeter and n represents the number

The **apothem** is a segment that connects the center of a regular polygon perpendicularly to a side of this **regular polygon**. The **apothem** is also the perpendicular distance from the center of this figure to a side. The **apothem** divides a side of this **regular polygon**. In Figure 1 below, a is the length of the apothem.

The **radius** is a segment that connects from the center of this regular polygon to a vertex of this polygon. The **radius** is also the distance from the center of this polygon to a vertex of the polygon. The **radius** divides an interior angle of this regular polygon. In Figure 1 below, r is the length of this radius.

Triangles of special right triangles, $30^\circ-60^\circ-90^\circ$ and $45^\circ-45^\circ-90^\circ$ and the trigonometric ratios can be used to solve problems involving regular polygons.
