Aitken,2012-10-05 Loss of biodiversity is among the greatest problems facing the world today Conservation and the Genetics of Populations gives a comprehensive overview of the essential background concepts and tools needed to understand how genetic information can be used to conserve species threatened with extinction and to manage species of ecological or commercial importance New molecular techniques statistical methods and computer programs genetic principles and methods are becoming increasingly useful in the conservation of biological diversity Using a balance of data and theory coupled with basic and applied research examples this book examines genetic and phenotypic variation in natural populations the principles and mechanisms of evolutionary change the interpretation of genetic data from natural populations and how these can be applied to conservation The book includes examples from plants animals and microbes in wild and captive populations This second edition contains new chapters on Climate Change and Exploited Populations as well as new sections on genomics genetic monitoring emerging diseases metagenomics and more One third of the references in this edition were published after the first edition Each of the 22 chapters and the statistical appendix have a Guest Box written by an expert in that particular topic including James Crow Louis Bernatchez Loren Rieseberg Rick Shine and Lisette Waits This book is essential for advanced undergraduate and graduate students of conservation genetics natural resource management and conservation biology as well as professional conservation biologists working for wildlife and habitat management agencies Additional resources for this book can be found at www.wiley.com/go/allendorf/populations

Population Dynamics Naomi Cappuccino, Peter W. Price, 1995-09-01 An understanding of the dynamics of populations is critically important to ecologists evolutionary biologists wildlife managers foresters and many other biologists This edited treatise brings together the latest research on how populations fluctuate in size the factors that drive these changes and the theories explaining how populations are regulated The book also includes specific chapters dealing with insects of economic importance Differential Equations and Applications in Ecology, Epidemics, and Population Problems Stavros

Busenberg, 2012-12-02 Differential Equations and Applications in Ecology Epidemics and Population Problems is composed of papers and abstracts presented at the 1981 research conference on Differential Equations and Applications to Ecology Epidemics and Population Problems held at Harvey Mudd College The reported researches consist of mathematics that is either a direct outgrowth from questions in population biology and biomathematics or applicable to such questions The content of this volume are collected in four groups The first group addresses aspects of population dynamics that involve the interaction between spatial and temporal effects The second group covers other questions in population dynamics and some other areas of biomathematics The third group deals with topics in differential and functional differential equations that are continuing to find important applications in mathematical biology The last group comprises of work on various aspects of differential equations and dynamical systems not essentially motivated by biological applications This book is valuable to students and researchers in theoretical biology and biomathematics as well as to those interested in modern applications of differential equations

The Population Ecology of Interest Representation Virginia Gray, David Lowery, 1996 This examination of lobbying communities explores how interest group populations are constructed and how they influence politics and public policy By examining how populations of interest groups are comprised this work fills an important gap between existing theories of the origins of individual interest groups and studies of interest group influence The population ecology model of interest communities developed here builds on insights first developed in population biology and later employed by organizational ecologists The model's central premise is that it is the environmental forces confronting interest organizations that most directly shape the contours of interest populations After examining the demography of interest organizations in the fifty American states the population ecology model is used to account for variations in the density and diversity of their interest communities the nature of competition among similar interest organizations to establish viable niches and the impact of alternative configurations of interest communities on the legislative process and the policies it produces These empirical findings suggest that the environment of interest communities is highly constraining limiting their size composition and potential impact on politics Virginia Gray is Professor of Political Science University of Minnesota David Lowery is Burton Craige Professor of Political Science University of North Carolina at Chapel Hill **2024-25 B.Sc.**
