

CIRCULAR CONCRETE TANKS WITHOUT PRESTRESSING

Section 1. Introduction

Design data for circular tanks built in or on ground have been confined almost entirely to walls with triangular load distribution, the top being unrestrained and the base assumed fixed. The assumption of fixed base is not generally in conformity with the actual conditions of restraint, and for other conditions there are little or no published data for designers to use. Adjustments then had to be made in accordance with the judgment of the engineer.

Existing data have been simplified and greatly augmented in this publication so that cylindrical concrete tank walls can now be designed for bases that are fixed, hinged, or have any other degree of restraint. A procedure is illustrated by which restraining moments at the edges can be determined and stresses due to such moments can be computed. The effect of radial displacements at the edges is also treated, and design data are given for trapezoidal distribution of loading on the walls.

Various layouts for circular roof slabs supported on tank walls are discussed and their design illustrated. Detailed designs are given for slabs without interior support as well as for slabs with one, four or seven columns. Various degrees of restraint at the edge of the slabs are included in the designs.

The subject is divided into sections, each of which deals with just one major phase of the design. The discussion in Sections 4 through 15 is given in connection with numerical examples most of which apply to a tank having the same dimensions. In order to design a particular tank, it is of course not necessary to make all the calculations in all the 12 sections. For example, to design an open-top tank supported on an ordinary wall footing, follow Section 3 and apply the

adjustment for radial displacements discussed in Section 8. If the tank wall carries a roof slab, say, without interior supports, add the calculations illustrated in Section 11 for the slab and, if the slab and wall are continuous, also make calculations as in Section 9.

In general, by proper combination of various sections, one can design numerous tanks involving many sets of conditions which cover practically the entire field of construction of cylindrical tanks built in or on ground. A typical example is given in detail in Section 16.

Section 2. Proportioning of Sections Subject to Ring Tension and Shrinkage

FIG. 1

Formulas for stresses in a reinforced concrete ring due to shrinkage will be derived first. Fig. 1 (a) illustrates a block of concrete reinforced with a bar as shown but otherwise unrestrained. The height of the block is chosen as 1 ft. since tension in a circular ring of a tank wall is computed for that height. The dimension marked x corresponds to the wall thickness. The steel area is A , and the steel percentage is p .

If the bar is left free as in Fig. 1 (b), shrinkage will shorten the 1-in. long block a distance of C , which denotes the shrinkage per
