

Mineral Properties

Have you ever heard of fools gold? It looks like gold, but it is another mineral. Many people have been fooled by it. Unfortunately, it is worth far less than gold.

Many minerals have “look-alikes.” That is why scientists have come up with different properties and tests to identify minerals. Some properties are more reliable than others when identifying minerals. The properties of minerals are:

Color: Most minerals cannot be identified by color alone. Many minerals, such as gold and pyrite, have the same color. Other minerals, such as quartz, have many different colors.

Streak: When you rub a mineral on a piece of tile, it may leave a streak of powder. Streak is the color of the powder left by the mineral. The color of a mineral's streak is very important. A mineral may have different colors, but it always leaves the same color streak. For example, hematite can be silver or red, but it will always leave a red-brown streak.

Luster: The way a mineral reflects light is called its luster. Luster can be metallic or nonmetallic. Minerals with metallic luster shine like polished metals. Those with nonmetallic luster have no metallic shine.

Hardness: The hardness of a mineral is its resistance to being scratched. To find out how hard a mineral is, we test it against other minerals of known hardness. Minerals are often compared to the hardness of glass which is 5.5. If a mineral scratches glass, it has a hardness greater than 5.5. If it does not scratch glass, it has a hardness less than 5.5.

Cleavage and Fracture: The way a mineral breaks can also be used to identify the mineral. Some minerals split along smooth, flat surfaces. These minerals are said to have **cleavage**. Other minerals break into pieces with uneven (jagged) surfaces. These minerals are said to have **fracture**.

Special Properties: Some minerals have special properties that can be used to identify them. For example, calcite will bubble when a drop of hydrochloric acid is placed on it. The mineral halite tastes salty, magnetite is magnetic, and talc feels slippery.
