

Study Guide: Physical and Chemical Oceanography

Effective composition of seawater is determined by:

- 1) Primary salinity - given amount of dissolved solids with respect to total weight, freshwater composition is 96.5% composition
- 2) Source - water coming through salt balance from atmosphere, rivers, rain, and ice melting contributes, resulting in different salinities, but all derived from same
- 3) Secondary salinities gained - through evaporation, precipitation, ice melting, and freezing, these processes will cause levels for future ocean water to rise

Effective salinity and composition on salinity:

- 1) Primary - from evaporation, precipitation
- 2) Secondary - from evaporation, precipitation, ice melting, and freezing

How temperature and salinity produce density, water volume, and pressure:

Temperature differences cause water layers:

- 1) warmest water starts at the top, cold water is more dense
- 2) warm, less dense water is floating on a colder, denser water below
- 3) when the temperature decreases, density is the water becomes is affected by its the density

Salinity differences cause water layers:

- 1) water with a lot of salt is more dense than water with less salt
- 2) water with less salt is less dense, floats above water with higher salinity
- 3) density is more affected by salinity than temperature
- 4) the higher the salinity, the more dense the water is, so the more dense the water is, the more dense the water is
