## Unit 1 Waves

- How is vibration an observable through continuous, transverse waves (as in the pendulum in this motion of the water).
- Transverse waves (the velocity) is a vibration (wave) the frequency controls wavelength. Longitudinal waves travel through a series of compressions and rarefactions.
- Waves can be described by amplitude, wavelength, and speed. Each one describes the wave.
- As a wave travels through a medium, particles are displaced and continue their normal motion about the wave source.
- Electromagnetic waves differ from other types of waves because they do not need matter through a medium.
- A vibrating wire is oscillating if it moves, you would need to know the maximum displacement from the equilibrium position.
- When the vibrating medium used is compressed matter, such as this case, you can describe the wavelength.
- As described in wave frequency, pressure varies the position of equilibrium as they oscillate.
- Sound is traveling through a medium, as a result it displaces particles of matter in the same direction the wave is traveling. This type of wave is a longitudinal wave.
- Because the particles move parallel to the direction the wave is traveling.

## Final Assignment Questions

Questions	Answers
What type of waves can only be described as medium?	Waves that travel along through matter is called <u>transverse waves</u> .
What is period?	Period is the <u>frequency</u> or the number of <u>cycles</u> .
What is the relationship between amplitude and period?	If the amplitude increases the period <u>decreases</u> and vice versa. So therefore the relation between amplitude and the period is <u>inverse</u> .
How does the type of medium affect a sound wave?	The wave speed for <u>longitudinal waves</u> is <u>higher</u> . But lower the speed of sound.
Describe the relationship between frequency and wavelength?	The <u>greater</u> the wavelength, the <u>higher</u> the frequency.
