In the answers, exercises and text there is inconsistency about whether the water formed in combustion reactions is gas or liquid. At room temperature it will ultimately finish up as a liquid, as shown here.

- 6 X has diffused more quickly, so it must be a lighter gas. Its particles have greater velocity than the particles of Y at the same temperature. (Note though that they will both have the same value for average kinetic energy.)
- 7 From the kinetic molecular theory we would expect a solid to be more dense than its liquid, and therefore that ice would sink in water.
- 8 Bubbles will be present through the volume of the liquid. A brown gas is visible above the brown liquid. As the two states are at the same temperature, the particles have the same average kinetic energy and are moving at the same speed. The inter-particle distances in the gas are significantly larger than those in the liquid.
- 9 At certain conditions of low temperature and low humidity, snow changes directly to water vapour by sublimation, without going through the liquid phase.
- 10 Steam will condense on the skin, releasing energy as it forms liquid at the same temperature (E–D on Figure 1.4). This is additional to the energy released when both the boiling water and the condensed steam cool on the surface of the skin.

core challenges of naming and addressing along with results from upper layer architecture All of this in Day s deft hands comes together in a tour de force of elegance and simplicity with the annoying turn of events that the answer has been staring us in the face Operating systems tell us even more about networking than we thought The result is in essence the first unified theory of networking and leads to a simpler more powerful and above all more scalable network infrastructure The book then lays the groundwork for how to exploit the result in the design development and management as we move beyond the limitations of the Internet Gaither's Dictionary of Scientific Quotations Carl C.
