Change the second paragraph to read:

For shear walls, the ratio for the wall with the largest shear per foot at or below two-thirds the height of the building is calculated. Or in the case of a two-story building, both levels. The value of r_{max} is computed from the total lateral load in the wall is multiplied by $10/r_w$ and divided by the story shear.

earthquake engineering evaluation and design with the aim of providing improved reliability in the engineering process by more directly relating computed response and expected structural performance. The main objective of this report is to summarize, critically review and compare the displacement based approaches proposed in the literature, thus favouring code implementation and practical use of rational and reliable methods.

Chapter 2: Seismic performance and design objectives of this report introduces concepts of performance levels, seismic hazard representation and the coupling of performance and hazard to define performance objectives. In fact, for displacement analysis to be relevant in the context of performance based design, the structural engineer must select appropriate performance levels and seismic loadings. A critical review of some engineering limit states appropriate to the different performance levels is therefore proposed.

In chapter 3: Conceptual basis for displacement based earthquake resistant design, the fundamental principles associated with displacement of the ground during an earthquake and the effects in terms of displacement in the structure are reviewed. The historical development guides the presentation with a review of general linear and nonlinear structural dynamics principles, general approaches to estimate displacement for both ground and structure, and finally a general presentation of the means to measure and judge the appropriateness of the displacements of the structure.

In section Chapter 4: Approaches and procedures for displacement based design can be somehow considered the fundamental part of the report, since a critical summary of the displacement based approaches proposed by different researchers is presented there. Displacement based design may require specific characterization of the input ground motion, a topic addressed in Chapter 5: Seismic input. In general, various pertinent definitions of input motion for non code format analysis are included, while peak ground parameters necessary for code base shear equations are only addressed as needed for the definition of motion for analysis.

Chapter 6: Displacement capacity of members and systems addresses the fundamental problem of evaluating the inelastic displacement capacity of reinforced concrete members and realistic values of their effective cracked stiffness at yielding, including effects of shear and inclined cracking, anchorage slip, bar buckling and of load cycling.

In Chapter 7: Application and evaluation of displacement based approaches, some of the many different displacement based design procedures briefly introduced in Chapter 4 are applied to various case studies, identifying and discussing the difficulties a designer may encounter when trying to use displacement based design. Results for five different case studies designed in accordance with eight different displacement based design methods are presented. Although, in general, case studies are considered a useful but marginal part of a state of the art document, in this case it has to be noted that chapter 7 is possibly the most innovative and fundamental part of the whole report. The conclusions of chapter 7 are the fundamental and essential conclusions of the document and allow foreseeing a bright future for displacement based design approaches.

The state of art report has been elaborated over a period of 4 years by Task Group 7.2: Displacement based design and assessment of fib Commission 7. Seismic design, a truly international team of experts representing the expertise and experience of all the important seismic regions of the world. In October 2002, the

NEHRP Recommended Provisions for Seismic Regulations for New Buildings and Other Structures, Part 2 - Commentary, 2000 Edition, March 2001, 2001 *Risk Management Series: Designing for Earthquakes - A Manual for Architects* Federal Emergency Agency, U. S. Department Security, 2013-04-14 Earthquakes in the United States are regional in their occurrence and while California is famous for its earthquake other states such as Texas have much less concern for the threat of temblors However architectural practice is becoming increasingly national and global and the architect in Texas may find that the next project is in California Thus it has become necessary for the professional architect to have some knowledge of the earthquake problem and how design seeks to control it *Designing for Earthquakes a Manual for Architects* is intended to explain the principles of seismic design for those without a technical background in engineering and seismology The primary intended audience is that of architects and includes practicing architects architectural students and faculty in architectural schools who teach structures and seismic design For this reason the text and graphics are focused on those aspects of seismic design that are important for the architect to know Because of its non technical approach this publication will also be useful to anyone who has an interest and concern for the seismic protection of buildings including facility managers building owners and tenants building committee participants emergency service personnel and building officials Engineers and engineering students will also gain from this discussion of seismic design from an architectural viewpoint The principles discussed are applicable to a wide range of building types both new and existing The focus is on buildings that are designed by a team that includes architects engineers and other consultants **The Seismic Design Handbook** Farzad Naeim, 1989-08-31
