Templates are used to generate all kinds of text including computer code The last decade the use of templates gained a lot of popularity due to the increase of dynamic web applications Templates are a tool for programmers and implementations of template engines are most times based on practical experience rather than based on a theoretical background This book reveals the mathematical background of templates and shows interesting findings for improving the practical use of templates First a framework to determine the necessary computational power for the template metalanguage is presented The template metalanguage does not need to be Turing complete to be useful A non Turing complete metalanguage enforces separation of concerns between the view and model Second syntactical correctness of all languages of the templates and

generated code is ensured This includes the syntactical correctness of the template metalanguage and the output language Third case studies show that the achieved goals are applicable in practice It is even shown that syntactical correctness helps to prevent cross site scripting attacks in web applications The target audience of this book is twofold The first group exists of researcher interested in the mathematical background of templates The second group exists of users of templates This includes designers of template engines on one side and programmers and web designers using templates on the other side
