---

Fast Facts

**Scientific Method:** a problem-solving tool used by scientists to determine the validity of a hypothesis. It is an organized process for finding a solution to a question.

## Scientific Method Steps

### Step 1: State the problem in the form of a question

- It is extremely important to begin with a solid problem or question.
- A good question can be examined, measured and analyzed.
- Choose a problem that you do not know the answer to and a problem that you can work with.

### Step 2: Research the problem

- Research is a critical part of any science project or experiment.
- Research can either make or break the project.
- When doing research, use a wide variety of resources outside of the school library.
- Research resources: books, library index, newspapers, magazines, science videos, and internet.
- Scientists rely heavily on the scientific method because there are so many variables to consider and any one of them can affect the results of the experiment.

### Step 3: Form a hypothesis

- Hypothesis: an educated guess about a possible solution or answer to your problem or question
- Developing a good, solid hypothesis is the most difficult step of the scientific method.
- Your hypothesis is the center of your project.
- If the hypothesis doesn't make sense, the whole project won't make sense.
- When forming the hypothesis, stick with a simple statement, and make it precise and measurable.

### Step 4: Write down the procedures that will be used to test your experiment

- Detailing the entire experiment and recording all the variables analyzed, scientists are able to track the validity of the hypothesis.
- Baseline measurement: something to measure our variables with
- Writing your procedures will:
  - a) help one gather the necessary materials
  - b) make sure that the experiment fits the hypothesis that is being tested
  - c) help others who want to repeat the experiment

*The Politics and Rhetoric of Scientific Method* J. Schuster,R.R. Yeo,2012-12-06 The institutionalization of History and Philosophy

of Science as a distinct field of scholarly endeavour began comparatively early though not always under that name in the Australasian region. An initial lecturing appointment was made at the University of Melbourne immediately after the Second World War in 1946 and other appointments followed as the subject underwent an expansion during the 1950s and 1960s similar to that which took place in other parts of the world. Today there are major Departments at the University of Melbourne, the University of New South Wales and the University of Wollongong and smaller groups active in many other parts of Australia and in New Zealand. Australasian Studies in History and Philosophy of Science aims to provide a distinctive publication outlet for Australian and New Zealand scholars working in the general area of history, philosophy and social studies of science. Each volume comprises a group of essays on a connected theme edited by an Australian or a New Zealander with special expertise in that particular area. Papers address general issues however rather than local ones; parochial topics are avoided. Further more though in each volume a majority of the contributors is from Australia or New Zealand contributions from elsewhere are by no means ruled out. Quite the reverse in fact they are actively encouraged wherever appropriate to the balance of the volume in question.
