

## Protein Synthesis Lab

**Purpose:**

Recognize that the sequence of bases in DNA determines the shape, structure, and function of a protein.

### Materials:

- Scissors
- White paper
- Pencil
- Construction paper
- Lab handout
- Tape

**Background:**

DNA is the molecule that stores the genetic information in your cells. That information is coded in the four bases of DNA: C, G, A, and T. The DNA directs the functions of the cell on a daily basis and will also be used to pass on the genetic information to the next generation. Because of its critical role in all the functions of the cell, DNA is kept protected in the nucleus of eukaryotic cells.

DNA is organized into sections called genes. Gene code for proteins, and it is proteins that do all the work in the cell. They function as structural proteins that serve as the building blocks of cells and bodies. They also function as enzymes, who are the little molecular chemists in bodies.

Proteins are made in the cytoplasm by protein factories called ribosomes. So, the information from DNA must be transmitted from the nucleus to the cytoplasm. Each gene on the DNA is read and codes directly for mRNA molecules. The mRNA is made by matching its complementary bases- C, G, A, and U to the DNA bases. The mRNA molecule then leaves the nucleus and carries the code for making the p[rotein from the DNA gene to the ribosome in the cytoplasm.

The ribosome reads the sequence of bases on the mRNA in sets of three called codons. Another type of RNA, tRNA, brings the protein building blocks, amino acids, to the ribosome as they are needed. The ribosome bonds the amino acids together to build the protein coded for by the gene back in the nucleus.

### Procedure:

1. Your group should obtain one sheet of paper with your four sections of DNA. Cut the strips out along straight lines and tape them together to make a long one-sided DNA molecule. Each section is numbered. Lay them out on the desk from left (#1) to right (#4). See the diagram below.

2. We are going to use this section of our DNA as a gene to make a protein the cell needs. Remember it used to be part of a double-stranded DNA molecule. But it has already been unzipped and now will be used as the template to build your mRNA, one base at a time. So first design an RNA polymerase enzyme to do this mRNA synthesis job.
3. **TRANSCRIPTION:** You have been supplied with mRNA nucleotide bases. Build a mRNA molecule from this gene by matching the mRNA bases to your DNA template, one base at a time. Tape this mRNA molecule along its length to simulate the strong bonds that the RNA polymerase makes between the mRNA bases. This way, it will be a stable molecule and can

**Alkaline Phosphatase** Robert B. McComb, George N. Bowers, Jr., Solomon Posen, 2013-11-11 There can be no doubt that alkaline phosphatase is one of the most extensively investigated of all enzymes This has resulted from the ubiquity of its distribution and from the ease and sensitivity with which its activity can be measured Unfortunately these wide ranging but often superficial experimental studies have been followed up by intensive and systematic investigations in only a few limited areas of the biochemistry and chemical pathology of alkaline phosphatase The result has been the accumulation of a scientific literature of intimidating proportions and the inevitable rediscovery of already known facts about the enzyme Scientists are taught early in their careers that in the words of Sir John Herschel Hasty generalization is the bane of science Nevertheless moments arrive in all spheres of scientific activity when generalization becomes essential to codify and to select from the mass of data already accumulated and to provide starting points for new developments and new lines of investigation This is especially true in a field such as alkaline phosphatase research in which very real dangers exist that the seeds of fundamental understanding will be lost amidst an unexamined harvest of empirical observations The history of the study of alkaline phosphatase provides several instances when valuable generalizations have emerged Occasionally the conclusions drawn on the basis of available evidence were wrong more frequently they have stood the test of further

experimentation and always they have provided new insights into the nature and properties of this enzyme      *Watson And DNA* Viktor K. McElheny, 2009-03-25 The most influential scientist of the last century James Watson has been at dead center in the creation of modern molecular biology This masterful biography brings to life the extraordinary achievements not only of Watson but also all those working on this cutting edge of scientific discovery such as Walter Gilbert Francis Crick Francois Jacob and David Baltimore From the ruthless competition in the race to identify the structure of DNA to a near mutiny in the Harvard biology department to clashes with ethicists over issues in genetics Watson has left a wake of detractors as well as fans Victor McElheny probes brilliantly behind the veil of Watson's own invented persona bringing us close to the relentless genius and scientific impresario who triggered and sustained a revolution in science
