

SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety checks before releasing the set to the customer:

1. Check the stand/paper support for modification or poorly installed connections. Check the entire front surface for visible splatters and bridges.
2. Check the interlock wiring to ensure that no wires are "pooled" or contact high-voltage regions.
3. Look for questionable replacement parts, particularly capacitors, that were installed during a previous repair. Point them out to the customer and recommend their replacement.
4. Look for parts which, though functioning, show obvious signs of deterioration. Point them out to the customer and recommend their replacement.
5. Check the line cord for cracks and abrasion. Recommend the replacement of any such line cord to the customer.
6. Check the E_h voltage to make sure it is the value specified.
7. Check the metal trim "insulation" inside screws and all other exposed metal parts for AC leakage. Check leakage as described right.

LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a metal-to-metal contact (maximum 0.1 sec. 500 megohms). Leakage current can be measured by any one of three methods:

1. A commercial leakage meter such as the Simpson 220 or GCA WT-500X. Follow the manufacturer's instructions on their instruments.
2. A battery-operated AC millivoltmeter. The Iwata Precision 140 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "load" resistance is 0.15 Ω , so existing meters must have an accurate low-voltage scale. The Simpson 260 and Sencore 250-40T are examples of a VOM that is suitable. Nearly all battery-operated digital multimeters that have a 0.1 V AC range are suitable. (See Fig. 4.)
