

Study Guide: Physical and Chemical Oceanography

Effective composition of seawater controlled by:

- 1) Evaporation/precipitation - gives control by removing salt content from surface during evaporation, and adding salt content back into surface during precipitation
- 2) Runoff - water moving through salt to lower salt concentrations during rain, and no moving saltwater, leaving behind saltwater and all dissolved substances
- 3) Geological processes - dissolved chemical compounds released or held through volcanoes, hydrothermal vents, and other geological processes

Effective evaporation and precipitation on salinity:

- 1) Evaporation - water evaporates, leaving salt behind
- 2) Precipitation - water precipitates, adding salt back into surface

How temperature and salinity produce density, water volume, and pressure:

Temperature differences cause water density:

- 1) Warm water is less dense than cold water
- 2) Warm water is less dense than cold water, so it rises and cold water sinks
- 3) When the temperature difference is large, the density difference is large, so the water moves faster

Salinity differences cause water density:

- 1) Water with higher salinity is denser than water with lower salinity
- 2) Water with higher salinity, and lower temperature, is the densest water in the ocean
- 3) The density difference is large, so the water moves faster

Runoff:

Runoff is the water that runs off the land and into the ocean, adding salt to the water.

Evaporation/precipitation:

Evaporation is the process of water turning into vapor, and precipitation is the process of water falling as rain or snow.

Geological processes: - the processes that shape the Earth's surface, including erosion, sedimentation, and tectonics.

Runoff that affects the ocean: - the water that runs off the land and into the ocean, adding salt to the water.

Evaporation/precipitation that affects the ocean: - the process of water turning into vapor, and precipitation falling as rain or snow, adding salt to the water.
