

Moon Note-Taking Guide

Why do we see the same face of the moon?

Because the moon rotates around its axis at the same rate that it orbits Earth, we always see the same side of the moon. This is called synchronous rotation. The moon's rotation period is 27.3 days, and its orbital period is also 27.3 days. This is a result of the fact that the moon was formed from the same material that formed Earth, and it has been tidally locked to Earth since then.

The Moon

The moon is the only natural satellite of Earth. It is a rocky body with a heavily cratered surface. The moon's diameter is about 1/4 that of Earth's, and its mass is about 1/80 that of Earth's. The moon's surface is covered in a layer of dust and small rocks called regolith. The moon's atmosphere is extremely thin, and it has no magnetic field.
