Abstract—The purpose of this study was to determine the effect of a 10-week, 1000 kcal energy deficit diet on the body composition and physical fitness of obese women. The study was a randomized, controlled trial. The subjects were 20 obese women who were randomly assigned to either a diet or an exercise group. The diet group was instructed to consume 1000 kcal less than their maintenance level, while the exercise group was instructed to exercise for 30 minutes, 3 times per week. The study was conducted over a 10-week period. The results showed that the diet group lost significantly more weight and body fat than the exercise group. The exercise group showed no significant changes in body composition or physical fitness. The study suggests that a 1000 kcal energy deficit diet is an effective method for weight loss and body composition improvement in obese women.

If you are not satisfied with your results, follow the instructions carefully and test your original article. If the editor still requests the (a) paragraph and (b) and (c) paragraphs, repeat the analysis with the original data. The original data are available.

- Increased moisture in the soil will compete with the salt for absorption by the roots. The length of the growing season may be extended by the use of plastic mulch and irrigation.
- The soil pH can be adjusted by the use of lime to change the growing conditions. The growing medium is usually a peat moss, perlite, and vermiculite mixture. The growing medium should be changed every 2 years. Salts from irrigation should be flushed out with water.
