- As is true for all other forms of light, ultraviolet light is also made up of photons. The only difference between ultraviolet and visible light is the frequency of the photons. Ultraviolet photons have a higher frequency than visible photons, which means they have more energy. This is why ultraviolet light can cause sunburns and other skin damage, while visible light cannot. The energy of a photon is directly proportional to its frequency, so higher frequency light has more energy per photon. This is why ultraviolet light is more effective at killing bacteria and viruses than visible light. It is also why ultraviolet light is used in tanning beds to make your skin look tanned. The photons in ultraviolet light have enough energy to excite the electrons in your skin, which makes them produce melanin, the pigment that gives your skin its color. So, while ultraviolet light is made up of photons just like visible light, the photons in ultraviolet light have more energy than the photons in visible light. This is why ultraviolet light can cause sunburns and other skin damage, while visible light cannot.
