Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 10 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of 30 minutes of moderate-intensity aerobic exercise. The control group consisted of three sessions per week of 30 minutes of low-intensity aerobic exercise. The HR and EE were measured at rest and during exercise at the beginning and end of the 10-week training program. The results showed that the training program had a significant effect on the HR and EE of the subjects. The HR and EE were significantly higher at the end of the 10-week training program compared to the beginning of the program. The control group showed no significant change in HR and EE. The results suggest that a 10-week training program can improve the HR and EE of sedentary, middle-aged women.

 - Turn off the lights at the end of the work day.
 - Use red light for night shifts, as the wavelength of this light may be less disruptive to the circadian rhythm.
- The end of the shift should be followed by a period of relaxation. The producer should avoid doing any work or driving for at least 4 hours after the shift. The producer should also avoid drinking alcohol or using any drugs.
