sensitive solutions CSS reflect the need to consider highway projects as more than just transportation facilities Depending on how highway projects are integrated into the community they can have far reaching impacts beyond their traffic or transportation function CSS is a comprehensive process that brings stakeholders together in a positive proactive environment to develop projects that not only meet transportation needs but also improve or enhance the community Achieving a flexible context sensitive design solution requires designers to fully understand the reasons behind the processes design values and design procedures that are used This AASHTO Guide shows highway designers how to think flexibly how to recognize the many choices and options they have and how to arrive at the best solution for the particular situation or context It also strives to emphasize that flexible design does not necessarily entail a fundamentally new design process but that it can be integrated into the existing transportation culture This publication represents a major step toward institutionalizing CSS into state transportation departments and other agencies charged with transportation project development

Guidance for Implementation of the AASHTO Strategic Highway Safety Plan, 2004 Intersection Geometric Design and Operational Guidelines for Older Drivers and Pedestrians L. K. Staplin, 1997 **Guidelines for Right-turn Treatments at Unsignalized Intersections and Driveways** Tanweer Hasan, Robert W. Stokes, 1996 Guidelines for right turn treatments at unsignalized intersections and driveways on the state highway system of Kansas were developed in this study Two types of treatments full width lane and taper were considered over the do nothing radius treatment The guidelines were based on the results of an economic analysis conducted over a wide range of traffic volumes and speeds A simple model was developed to determine the operational effects of right turn movements at unsignalized intersections and driveways on high speed highways The operational effects were estimated in terms of delay and excess fuel consumption experienced by through vehicles due to the right turns The relationship between speed differential and accidents was used to estimate the reduction in right turn same direction rear end accidents that would be expected to result from the provision of a right turn treatment Comparison with other guidelines and validation of existing right turn treatments at the study sites indicate that the range of the guidelines developed in this study is reasonable They are also more definitive because they consider highway operating speed They are more flexible in determining an appropriate treatment because an intermediate taper treatment is considered
