The Filth Disease Jacob Steere-Williams,2020 Shows how the investigation of local outbreaks of typhoid fever in Victorian Britain led to the emergence of the modern discipline of epidemiology as the leading science of public health Typhoid fever is a food and water borne infectious disease that was insidious and omnipresent in Victorian Britain It was one of the most prolific diseases of the Industrial Revolution There was a palpable public anxiety about the disease in the Victorian era no doubt fueled by media coverage of major outbreaks across the nation but also because Queen Victoria s husband Prince Albert died of the disease in 1861 Their son and heir Prince Albert Edward contracted and nearly succumbed to typhoid a decade later in 1871 The Filth Disease shows that typhoid was at the center of a number of critical debates about health science and governance Victorian public health reformers the book argues working in central and local government framed typhoid as the most pressing public health problem in order to persuade local officials to implement sanitary infrastructure to prevent the spread of disease In this period British epidemiologists uncovered how typhoid is spread via food and water supplies disrupting the longstanding idea that typhoid was spread via filth In the process the modern discipline of epidemiology emerged as the chief science of public health Typhoid was as much a social and political problem as it was a scientific one and The Filth Disease provides a striking reminder of the cultural context in which infectious diseases strike populations and how scientists study them **The Cloud Revolution** Mark P. Mills,2021-11-02 The conventional wisdom on how technology will change the future is wrong Mark Mills lays out a radically different and

optimistic vision for what's really coming. The mainstream forecasts fall into three camps. One considers today as the new normal where ordering a ride or food on a smartphone or trading in bitcoins is as good as it's going to get. Another foresees a dystopian era of widespread digitally driven job and business destruction. A third believes that the only technological revolution that matters will be found with renewable energy and electric cars. But according to Mills, a convergence of technologies will instead drive an economic boom over the coming decade, one that historians will characterize as the Roaring 2020s. It will come not from any single big invention but from the confluence of radical advances in three primary technology domains: microprocessors, materials, and machines. Microprocessors are increasingly embedded in everything. Materials from which everything is built are emerging with novel, almost magical capabilities. And machines which make and move all manner of stuff are undergoing a complementary transformation. Accelerating and enabling all of this is the Cloud, history's biggest infrastructure, which is itself based on the building blocks of next-generation microprocessors and artificial intelligence. We've seen this pattern before. The technological revolution that drove the great economic expansion of the twentieth century can be traced to a similar confluence, one that was first visible in the 1920s: a new information infrastructure, telephony, new machines, cars, and power plants, and new materials, plastics, and pharmaceuticals. Single inventions don't drive great long-cycle booms. It always takes convergent revolutions in technology's three core spheres: information, materials, and machines. Over history, that's only happened a few times. We have wrung much magic from the technologies that fueled the last long boom. But the great convergence now underway will ignite the 2020s. And this time, unlike any previous historical epoch, we have the Cloud amplifying everything. The next long boom starts now.

Coasts and Estuaries Eric Wolanski, John W. Day, Michael Elliott, Ramachandran Ramesh, 2019-01-24. *Coasts and Estuaries: The Future* provides valuable information on how we can protect and maintain natural ecological structures while also allowing estuaries to deliver services that produce societal goods and benefits. These issues are addressed through chapters detailing case studies from estuaries and coastal waters worldwide, presenting a full range of natural variability and human pressures. Following this, a series of chapters written by scientific leaders worldwide synthesizes the problems and offers solutions for specific issues, graded within the framework of the socio-economic environmental mosaic. These include fisheries, climate change, coastal megacities, evolving human-nature interactions, remediation measures, and integrated coastal management. The problems faced by half of the world living near coasts are truly a worldwide challenge, as well as an opportunity for scientists to study commonalities and differences and provide solutions. This book is centered around the proposed DAPSI WRM framework, where drivers of basic human needs require activities that each produce pressures. The pressures are mechanisms of state change on the natural system, and impacts on societal welfare, including well-being. These problems then require responses, which are the solutions relating to governance, socio-economic, and cultural measures. Scharin et al. 2016. Covers estuaries and coastal seas worldwide, integrating their commonality, differences, and solutions for sustainability.

Includes global case studies from leading worldwide contributors with accompanying boxes highlighting a synopsis about a particular estuary and coastal sea making all information easy to find Presents full color images to aid the reader in a better understanding of details of each case study Provides a multi disciplinary approach linking biology physics climate and social sciences
